Precious Metals Transaction Analytics

Data Consolidation, Analysis & Strategic Reporting

Lavish Pandey | Jan 2024 – Jul 2026 | 176 transactions, 2 asset categories | Self-built sample dataset

Objective

Build and analyze a structured precious metals transaction dataset — consolidating records into a single analytical model to evaluate spend distribution, price-entry patterns, and cost efficiency, and to practice end-to-end data analysis and reporting workflows.

Dataset

Self-built, modeled on realistic purchase patterns

Time Span

31 months of transaction activity (2024–2026)

Scope

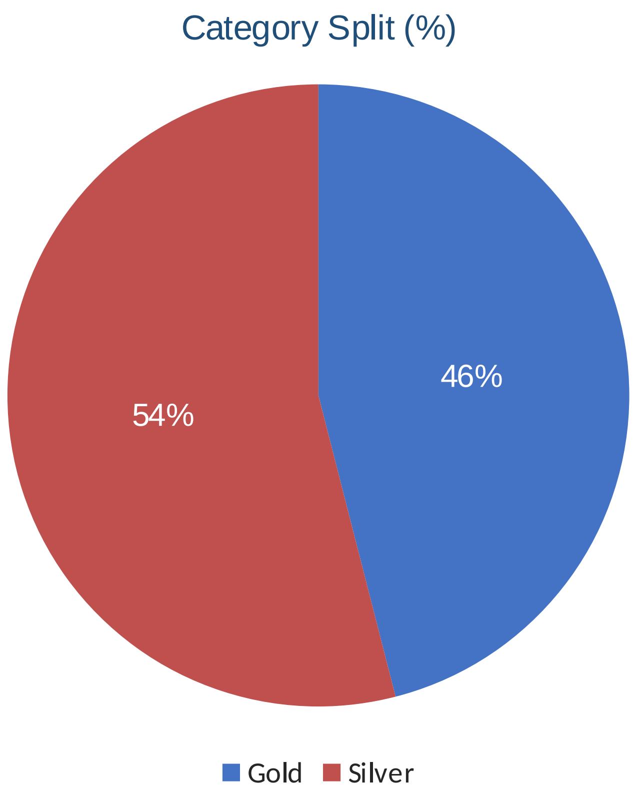
176 transactions, Gold + Silver categories

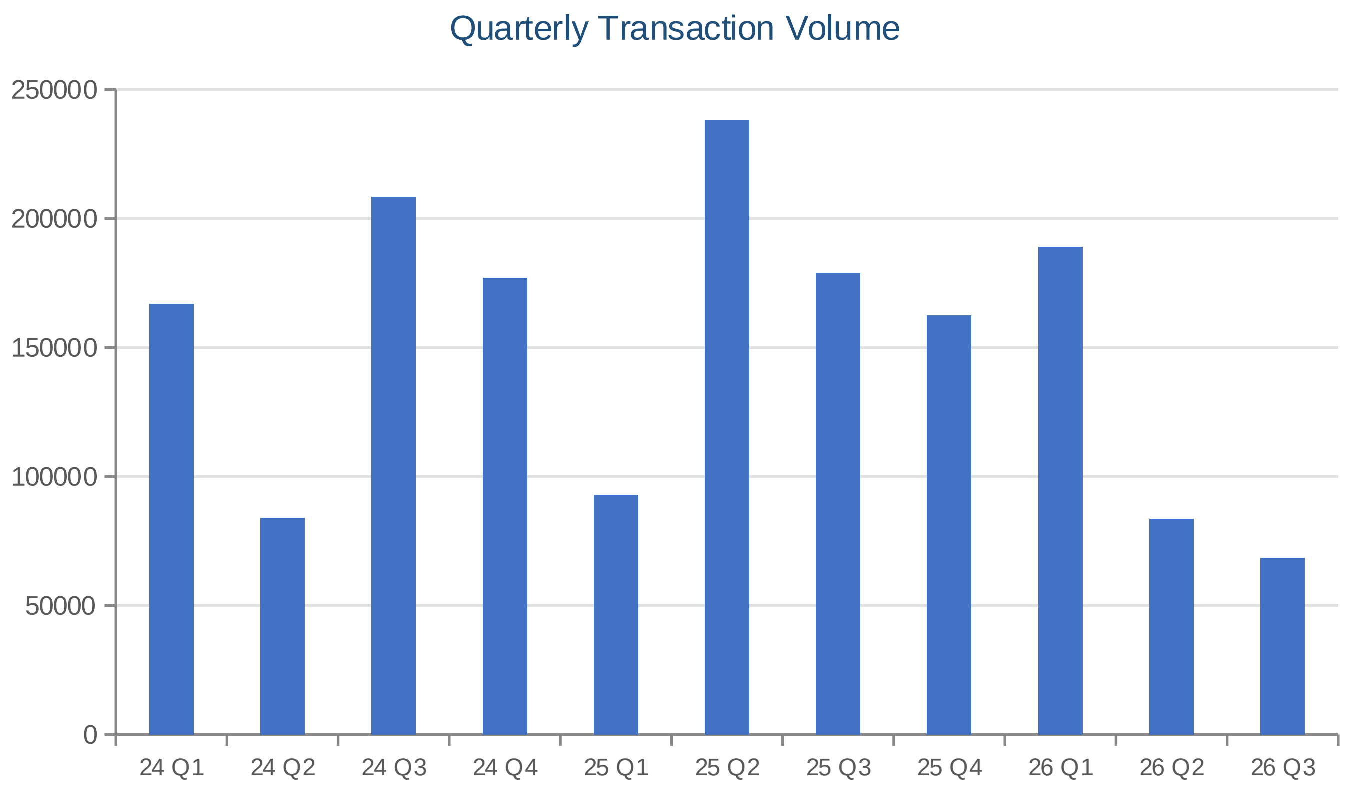
Approach

01	**Dataset Construction**	Built a structured transaction dataset modeled on realistic gold & silver purchase patterns and pricing trends.
02	**Data Consolidation**	Standardized all records into one unified transaction table with consistent schema.
03	**Categorical Analysis**	Segmented transactions into price bands to identify entry-price concentration by category.
04	**Trend Analysis**	Built a chronological, formula-driven cumulative model to visualize spend pace over time.
05	**Synthesis**	Derived quantified findings and translated them into forward-looking recommendations.

Key Findings

₹16.5L	**176**	**~₹9,375**	**~3%**
Total Transaction Value	Transactions	Avg. Transaction Size	GST Cost Impact





Strategic Recommendations

1

Consolidate Transaction Frequency

High transaction count at small sizes increases cumulative GST cost. Batching into fewer, larger purchases reduces this fixed cost without changing total volume.

2

Rebalance Toward Price-Trough Entries

Gold purchases clustered mid-range rather than at observed lows. Timing future entries against a moving-average trigger would improve average cost basis.

3

Maintain Consistent Purchase Discipline

The recurring transaction pattern reduces timing risk and should be preserved even if batching is adopted.

Skills Demonstrated

- Dataset Design & Construction
- Data Cleaning & Standardization
- Formula-Driven Financial Modeling
- Categorical & Trend Analysis
- AI-Assisted Structured Development
- Strategic Documentation & Reporting

Self-built synthetic dataset, created using AI-assisted analysis and structured prompt-driven development.
